

Use Case — AI Relationship Manager BEFORE drop-off

Client: Indian Bank

Technical Service Provider: Silver Suits AI

Date: April 20, 2026

Version: 2.3

1. Objective

Users get confused about how they can achieve their tasks in the mobile app. For example, when the user is applying for a loan in the mobile app, there is a confusion and inconvenience in following the right steps to execute the right operation.

Silver Suits AI brings forward a human-like AI solution (AI Relationship Manager with regional accents) that coordinates with users on the mobile banking app to uplift conversions. It identifies when the user is about to drop off (e.g. rage clicking) and initiates a popup for the user to engage with AI RM regarding the same.

To enable the above-mentioned solution, there are multiple compliance approvals to follow data processing & storage policy. While the “base architecture” compliance doc covers infrastructure safety, this document elaborates on the compliance related to the process and functional safety for this particular use case

2. Functional Workflow & Decision Logic

The following categories of steps are followed. A summary is provided in the table below and details of each step is provided below the table.

Step #	Description of the Step	Required Condition	Input Parameters
1	Trigger Event	“Help” Button click	Button type, current status of the form
2	Rule Engine Execution	Fill up fields, parameters to fill	Field ID, Field status, validation regex
3	Exception Handling & Fallbacks	Task failure(s)	User voice not audible
4	Change Management (Periodic)	Business Logic changes	new/changed/deleted logic(s)

SILVER SUITS AI

AI Coworkers for BFSI Segments to Scale

Step 1: Trigger Event

Our system looks for the primary trigger: "Help button clicked by the user" event received when the Bank's System sends a REST API call to the Silver Suits AI Backend.

To evaluate this trigger, the following secondary conditionals are ingested:

- Customer Profile: recent vs old, transaction type, language, other available/sharable parameters
- Form Profile: Field IDs, Field statuses, validation regex, supporting information
- Nearest branch: geography, human RM mapped
- Time: timestamp

These parameters are ingested and evaluated with a rule engine (see step 2 below). This engine helps to decide when to interact, how to interact (the conversation script), what command to follow, and visibility of such conversations.

Step 2: Rule Engine Execution

The objective of the rule engine is to make decisions based on available information. The following table showcases these decisions.

Decision to be made	Possible Outputs	Parameters involved	Fallback(s)
When to converse?	Button clicked, popup triggered	User engagement on form	Technical glitch, not accepted, dropped midway
How to converse?	Calling script, outcomes	User profile, form profile, script format	Insufficient information for script
What Command to Follow?	Filling up form, flagging incorrect outcomes	Field ID, Value, Validation regex	Incorrect/missing parameters
Logging	ALL input and output	Transcript, Outcome, Form fields+values	Form NOT submitted

A dashboard is provided to the concerned business team with all these parameters and logic operators that run the rule engine. For example,

- IF [form_fields_fillup > 75%] AND [count(repeat_clicks) > 5] THEN [action = {trigger_popup} at {immediately} with calling_script = {conversation} and lang = {en}]
- IF [technical_glitch = "false"] AND [inactive_time > 20 sec] THEN [action = {trigger_popup} at {immediately} with calling_workflow = {push_user} and lang = {hin}]

SILVER SUITS AI

AI Coworkers for BFSI Segments to Scale

A glimpse of the rules builder is showcased below:

Please note: The UI is subject to change based on business requirements, compliance approvals and development activities. The above image is just a glimpse for easy understanding

Please note the existing constraints of the rule engine below. Expanding the scope of these constraints are possible based on mutual agreement.

- Available operators: OR, AND, IF/THEN, COUNT, MAX/MIN
- Available parameters: As per agreement with business & compliance teams
- Activation/Deactivation Time: an average TAT of 14 business days (subject to testing and approval timelines)

Step 3: Exception Handling & Fallbacks

Possible Fallbacks	What Happens per fallback
Technical Glitch: NOT connected with user	Log in analytics board and assign the user to a human RM from the nearest branch
Connect NOT accepted by user	Log in analytics board and if this happens twice a day per user, assign the user to a human RM from the nearest branch
Connect drop midway	Only save the existing transcript and log as “incomplete call”
Insufficient user info	Move forward with the existing info only to the LLM (AI Brain)

SILVER SUITS AI

AI Coworkers for BFSI Segments to Scale

Insufficient Parameters	Flag to the user and ask for more details
Clashing Parameters	Ask the user for a final judgement
User misusing / overusing	Stop at a cap value, log in dashboard, assign to nearest RM

3. Data Minimization & Use-Case Specific PII

Data Point	Purpose / Description	Stored?	Compliance
User Profile	To contextualize all calls	In bank's DB only	Yes**
Field Profile	To contextualize all calls	In bank's DB only	Yes**
Conversation Transcript	For audit purpose and analysing outcomes	In bank's DB only	Yes**
Voice biometrics	NOT stored	No	NA
Connect Logs & Recordings	Stored only based on prior request	In bank's DB only	Yes**
Analysis (PCA)	For outcome analysis	In bank's DB only	Yes**

**With "Yes", the following note is intended:

1. All data is stored and processed within Indian borders. No data is sent outside India at any point of time.
2. All processing for this use case - including STT (ElevenLabs), LLM (Azure OpenAI), and TTS (Cartesia) - happens strictly within India-based data centers.
3. No models are trained with these data points. Zero Data Retention
4. All data is encrypted at rest (AES-256) and in transit (TLS-1.2+)
5. Access control (authentication) required as per bank's policy for data in DB

The "base architecture" document has details for the same along with relevant certificates (ISO, SOC, DPDP, DPA, etc.) attached.

Bank Ownership of Persistent Data prevails. All persistent data (transcripts, outcomes, and metadata) is stored exclusively in the Bank's own database (On-Prem or Bank-controlled Cloud). Silver Suits AI only accesses this to read/write specific records. In order to view these data points, it is restricted to the bank's whitelisted IPs and requires authenticated login.

4. Conversation Safety & Guardrails

This section outlines the guardrails in place to adhere to compliance, business processes, and workflow management.

Calling Workflows:

The following is a rough view of calling workflows utilized for this use case:

Sl. No.	Category	Purpose	Example(s)
1	Opening Line	Initiate conversation with the user	AI Assistant: "Hello {user_name}, I can see that you are facing issues with {field_name(s)}. Let me help you"
2	Problem Identification	Save the context about the user pain point (if explicitly stated by the user)	User: "I am facing issues with {issue category} since {timeline}" User: "I tried doing {trials} and this happened. What to do?"
3	Follow Up Questions	Ask for more context from the user	AI Assistant: "For this field, please share {expected_value} also"
4	Confirmation	Confirm the transaction / command	AI Assistant: "Kindly confirm whether you want to {command summary}"

Please note that:

- Any significant change to the calling workflow above would require separate approval from the business team(s) at Indian Bank and Silver Suits AI both. However, shrinking the calling workflow (skipping questions/probes) will not require separate approvals.
- Parameters (e.g. language) are decided according to the rule engine. Every parameter has a default value set always.
- Noise cancellation measures are in place to prevent ambiguous user inputs.
- The conversation may stop anytime midway based on user or by the rule engine (e.g. cap usage per usage is hit)
- Every command execution is finally confirmed from the user based on app authentication. Silver Suits AI does NOT handle user authentication in the app.

DEV and PROD environments:

A DEV environment is set up to test the calling workflows. Evals reports are generated where possible edge cases are passed through the systems and the output is analysed by humans (limited set) and AI (larger sets) both.

A PROD environment is set up to deploy the entire architecture for actual usage. Evals reports are generated where live cases are analysed and possible enhancements are extracted for future development and deployments.

Branding Guidelines:

The marketing team(s) from Indian Bank needs to provide the specifics of the branding guidelines as mentioned below:

- Color code
- Font Styles
- Name of the AI Agent(s)
- Other specifications as per need

The same will be implemented in popups and conversations as per mutual agreement.

Languages used during AI conversations:

The following languages are supported by the AI RMs provided by Silver Suits AI. New languages will be trained and incorporated with time. The rule engine decides on one of the following ten (10) languages only and out-of-scope languages are defaulted to Hinglish:

1. English
2. Hindi (or) Hinglish
3. Tamil
4. Telugu
5. Gujarati
6. Kannada
7. Punjabi
8. Marathi
9. Malayalam
10. Bengali

Latency Standards:

As per input from the compliance teams in Indian Bank, each API call (e.g. button clicked) is assumed to be triggered instantly (a latency within a few milliseconds range).

5. Monitoring and Auditability

A detailed parameter list is mentioned in the Appendix section of the “Base Architecture” document regarding how each call conversation is reviewed. They are standard and new/change of parameters are allowed as per requests raised.

Emergency Override Dashboard:

As requested by the compliance team, an “emergency override” tab will be provided where per use case, per digital journey and per field, emergency addition of inputs (e.g. RBI guidelines effective immediately) will be ingested for the AI models to remain aware about it until rule engines are edited (e.g. the 14-day TAT for change) and pushed into PROD.

Consent to Converse:

Each conversation with the user is initiated based on explicit consent (e.g. clicking of “Yes” button by the user). Any deviations from this assumption needs to be flagged with Silver Suits AI and the same need to be passed as a parameter to the rule engine.

Grievance Redressal:

In compliance with the DPDP Act, any queries, grievances, or requests regarding data correction and nomination should be directed to the designated Data Protection Officer (DPO):

- Attn: Prateek Agrawal
- Email: prateek@silversuits.ai
- Response Timeline: All grievances will be acknowledged within 72 hours and resolved as per statutory timelines.

Legal coverage:

To ensure maximum legal rigor, specific protections regarding confidentiality and data handling are governed by separate, standalone documents incorporated by reference:

- Non-Disclosure Agreement (NDA)
- Data Sharing & Processing Agreement
- Compliance Engagement Document

Silver Suits AI agrees to provide reasonable cooperation and documentation should the Client be subject to a regulatory audit regarding the services provided herein, subject to the confidentiality terms of this agreement.

SILVER SUITS AI

AI Coworkers for BFSI Segments to Scale

Detailed legal agreements (Definitions, obligations, etc.) are mentioned under Appendix section in the “Base architecture” document.

Legend: Technical Terms

This section covers the explanation and general understanding of technical terms mentioned in this document

SL No.	Term	Description
1	Field ID	Every form consists of fields (e.g. Name, Phone) and each field is assigned one unique ID
2	Validation Regex	Every field has a constraint e.g. PAN field has <code>^[A-Z]{3}[PCHFATBLJG][A-Z]\d{4}[A-Z]\$</code>
3	REST API	a standardized menu that allows different software programs to talk to each other and exchange data over the internet.
4	Rule Engine	A logic processor that automatically executes specific actions when predefined conditions are met.
5	Transcript	A written, word-for-word record of a spoken conversation converted from audio into text.
6	Latency	The time delay between sending a request and receiving a response.

This document is confidential and intended for Indian Bank's concerned team(s) only.
